Set

(HashSet class implements your Set Interface)

Set is a Collection to store unique data.

Inside the Set no duplicate values are there.

set -> value -> Hash
add value again -> check if that hash is already present -> (same) it will not add it
                                                          -> (Different) it will add

// a -> jhgsdjksdg
// b -> jhgsdjksda

Set<Integer> set = new HashSet<>();
